Exam : AB-730

Title : AI Business Professional

Version : V9.02

1.HOTSPOT

For each of the following statements, select Yes if the statement is true. Otherwise, select No. NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
You can add a Microsoft Teams chat as a knowledge source to a Microsoft 365 Copilot agent.	☐	☐
You can add a Microsoft 365 Copilot conversation as a knowledge source to a Copilot agent.	☐	☐
You can use an image file, such as a JPG file, as a knowledge source for a Microsoft 365 Copilot agent.	☐	☐

Answer:

Answer Area

Statements	Yes	No
You can add a Microsoft Teams chat as a knowledge source to a Microsoft 365 Copilot agent.	☒	☐
You can add a Microsoft 365 Copilot conversation as a knowledge source to a Copilot agent.	☐	☒
You can use an image file, such as a JPG file, as a knowledge source for a Microsoft 365 Copilot agent.	☐	☒

Explanation:

Statements:

You can add a Microsoft Teams chat as a knowledge source to a Microsoft 365 Copilot agent.

Answer. Yes

You can add a Microsoft 365 Copilot conversation as a knowledge source to a Copilot agent.

Answer. No

You can use an image file, such as a JPG file, as a knowledge source for a Microsoft 365 Copilot agent.

Answer. NO

Microsoft 365 Copilot Agent Builder supports grounding agents in approved knowledge sources so responses are accurate and permission-trimmed. Teams chats can be used as a knowledge source: Microsoft Learn confirms you can ground an agent in Teams data, including chat messages (and optionally scope to specific chats), enabling the agent to reference collaboration context when answering questions.

A Copilot conversation itself is not a supported “knowledge source” option; knowledge sources are configured from items like SharePoint content, Teams, email, websites, uploaded files, and connectors—not prior chat transcripts.

Finally, JPG images are not supported as knowledge-source file types. Microsoft’s supported file types for agent knowledge include documents like .doc/.docx, .pdf, .ppt/.pptx, .txt, and Excel formats (.xls/.xlsx), but not image formats. Therefore, you cannot use a JPG as a knowledge source for a Copilot agent.

2.You are creating a prompt in Microsoft 365 Copilot to get information about a proposal. You need to

ensure that the response is grounded in the proposal's information.

What is the best approach to achieve the goal? More than one answer choice may achieve the goal.

Select the BEST answer.

- A. Instruct Copilot to rely on its training data to infer proposal details.
- B. Add a specific goal that you want Copilot to accomplish.
- C. Reference the proposal content in the prompt.
- D. Add context about the intended audience.

Answer: C

Explanation:

According to Microsoft AI Business Professional guidance for Microsoft 365 Copilot, grounding a response means ensuring the AI generates output based on specific, authoritative content rather than relying on generalized training data. When working with enterprise documents such as proposals, grounding is achieved by explicitly referencing the source material within the prompt.

Option C is correct because referencing the proposal content directs Copilot to use that specific document as the primary context for generating the response. Microsoft documentation emphasizes that effective prompts should include clear context and explicit references to relevant files, meetings, emails, or documents stored in Microsoft 365. This reduces hallucinations and ensures factual alignment with organizational data.

Option A is incorrect because relying on training data increases the risk of inaccurate or fabricated information.

Options B and D improve prompt clarity but do not guarantee grounding in the proposal itself.

Therefore, explicitly referencing the proposal content is the most reliable and best practice method for ensuring grounded, accurate responses in Microsoft 365 Copilot.

3.HOTSPOT

Select the answer that correctly completes the sentence.

Answer Area

From Microsoft 365, you the Researcher agent.

cannot modify the settings of

can modify the agent instructions of

can add an additional suggested prompt to

can delete one of the suggested prompts from

Answer:

Answer Area

From Microsoft 365, you the Researcher agent.

Explanation:

The correct completion is "cannot modify the settings of" because built-in agents such as the Researcher agent in Microsoft 365 Copilot are system-defined experiences. These agents are designed and managed by Microsoft to ensure consistent functionality, security, compliance, and alignment with responsible AI standards.

While users can interact with Researcher, provide prompts, and refine outputs during conversations, they

cannot directly modify the core system settings or configuration of the built-in agent from Microsoft 365. Administrative configuration and deeper customization are available when creating custom Copilot agents through approved development tools, but default Microsoft-provided agents have controlled configurations.

Options such as modifying agent instructions, adding prompts, or deleting suggested prompts imply direct structural customization of the built-in agent interface, which is not supported in the standard Microsoft 365 Copilot experience.

This reflects a key generative AI governance principle in enterprise environments: system-level controls remain centrally managed to maintain data protection, compliance, and responsible AI implementation across the organization.

4.You use Microsoft 365 Copilot.

You discover that you had a conversation that used a knowledge source that contains confidential information.

You need to delete the conversation data without requiring administrative approval. You must retain your other conversations, if possible.

What should you use?

- A. the Microsoft 365 Copilot app
- B. the Microsoft 365 admin center
- C. the Microsoft Purview compliance portal
- D. the My Account portal in Microsoft 365 Copilot

Answer: D

Explanation:

Microsoft 365 Copilot follows Microsoft's enterprise data governance and privacy principles, which allow users to manage their own conversation history where appropriate. According to Microsoft AI Business Professional guidance, users can review and delete individual Copilot conversation histories directly from their personal account settings without requiring administrative intervention.

Option D is correct because the My Account portal in Microsoft 365 Copilot allows individual users to manage their activity history, including deleting specific conversations. This enables targeted removal of sensitive interactions while retaining other conversation data.

Option A is incorrect because the Copilot app itself does not provide full account-level activity management capabilities.

Options B and C are administrative tools used for tenant-wide governance, compliance, retention policies, and eDiscovery. These portals typically require administrative privileges and are not intended for individual user self-service deletion of specific conversations.

Therefore, to delete a single confidential Copilot conversation without affecting other chats and without requiring administrator approval, the correct tool is the My Account portal in Microsoft 365 Copilot.

5.HOTSPOT

Select the answer that correctly completes the sentence.

From the Microsoft 365 My Account portal , if you select Delete history for the Copilot activity history, you can delete

- a specific conversation.
- a specific date range of activity
- all the Microsoft 365 Copilot activity.
- all conversations with a specific agent.

Answer:

From the Microsoft 365 My Account portal , if you select Delete history for the Copilot activity history, you can delete

- a specific conversation.
- a specific date range of activity
- all the Microsoft 365 Copilot activity.
- all conversations with a specific agent.

Explanation:

a specific date range of activity

The Microsoft 365 My Account portal provides users with control over their Copilot activity history in alignment with enterprise privacy and compliance standards. When selecting Delete history, users can remove Copilot activity based on a defined time range rather than deleting only a single conversation or all activity universally.

This functionality reflects Microsoft's commitment to transparency, user control, and responsible AI governance. Allowing deletion by date range enables organizations and individuals to manage data retention policies efficiently while maintaining compliance with regulatory frameworks such as GDPR and internal data governance policies.

The other options are incorrect because deleting a specific conversation or all conversations with a specific agent is not the primary method offered in the My Account activity deletion setting. Instead, deletion is structured around activity time periods.

This capability reinforces generative AI best practices: secure data management, lifecycle control of AI interactions, and user-directed privacy management within enterprise environments.

6.HOTSPOT

Select the answer that correctly completes the sentence.

Answer Area

If you start a temporary chat in Microsoft 365 Copilot, and then start a new chat, all the prompts and responses from the temporary chat will be

- deleted immediately
- deleted after one hour.
- moved to a private notebook.
- moved to your Microsoft OneDrive.

Answer:

Answer Area

If you start a temporary chat in Microsoft 365 Copilot, and then start a new chat, all the prompts and responses from the temporary chat will be

deleted immediately.

Explanation:

Temporary chat in Microsoft 365 Copilot is designed for privacy-focused, non-persistent interactions.

When a user initiates a temporary chat session, the conversation is not saved to Copilot chat history and is not retained for future reference within the standard conversation history interface.

Once the session ends or a new chat begins, the prompts and responses from that temporary session are deleted immediately. They are not moved to OneDrive, stored in a notebook, or retained for a delayed deletion period.

This feature supports secure and confidential usage scenarios where users may want to explore ideas, draft sensitive content, or test prompts without creating a stored record in their activity history.

From a generative AI governance perspective, this reflects Microsoft's design principle of providing configurable persistence levels, balancing productivity with enterprise security, compliance, and user privacy controls.

7.HOTSPOT

You run a prompt by using the Researcher agent in Microsoft 365 Copilot.

For each of the following statements, select Yes if the statement is true. Otherwise, select No. NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
You can continue the conversation in Copilot in Word.	☐	☐
You can continue the conversation in Copilot for Teams.	☐	☐
You can continue the conversation in Copilot in Outlook.	☐	☐

Answer:

Answer Area

Statements	Yes	No
You can continue the conversation in Copilot in Word.	☒	☐
You can continue the conversation in Copilot for Teams.	☒	☐
You can continue the conversation in Copilot in Outlook.	☒	☐

Explanation:

You can continue the conversation in Copilot in Word. Answer. Yes

You can continue the conversation in Copilot for Teams. Answer. Yes

You can continue the conversation in Copilot in Outlook. Answer. Yes

Microsoft 365 Copilot provides cross-application continuity across supported Microsoft 365 apps. When using the Researcher agent, users can continue or extend their work within applications such as Word, Teams, and Outlook.

In Word, users can incorporate research results directly into drafted documents, enabling seamless transition from research to content creation. In Teams, Copilot supports contextual collaboration by allowing insights from research to inform meetings or chats. In Outlook, findings can be referenced to

compose informed and data-driven communications.

This interoperability is enabled by Microsoft Graph integration, which allows Copilot to securely access and contextualize enterprise data across applications while respecting organizational permissions. These capabilities demonstrate effective management of prompts and conversations by maintaining workflow continuity, enhancing productivity, and supporting enterprise-grade collaboration powered by generative AI.

8.HOTSPOT

For each of the following statements, select Yes if the statement is true. Otherwise, select No. NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
You can review the Microsoft 365 Copilot activity history from the My Account portal.	☐	☐
When you delete the Microsoft 365 Copilot activity history, you also immediately delete all the associated notebooks and pages.	☐	☐
Users can delete their entire Microsoft 365 Copilot activity history, including their prompts and the responses Copilot returns.	☐	☐

Answer:

Answer Area

Statements	Yes	No
You can review the Microsoft 365 Copilot activity history from the My Account portal.	☒	☐
When you delete the Microsoft 365 Copilot activity history, you also immediately delete all the associated notebooks and pages.	☐	☒
Users can delete their entire Microsoft 365 Copilot activity history, including their prompts and the responses Copilot returns.	☒	☐

Explanation:

The first statement is correct because Microsoft 365 provides transparency and user control through the My Account portal, where users can review their Copilot activity history. This aligns with Microsoft's responsible AI and data governance principles, ensuring visibility into AI interactions.

The second statement is incorrect. Deleting Copilot activity history removes stored interaction records (such as prompts and responses), but it does not automatically delete associated notebooks, documents, or pages stored in services like OneDrive or SharePoint. Those files remain governed by standard Microsoft 365 retention and lifecycle policies.

The third statement is correct because users can delete their entire Copilot activity history, including both prompts and generated responses. This reinforces enterprise-grade privacy controls and regulatory compliance requirements.

These controls demonstrate core generative AI fundamentals: transparency, user data ownership, security boundaries, and responsible lifecycle management of AI-generated interactions within Microsoft 365 environments.

9.You create a Microsoft 365 Copilot notebook and add a file named Process.docx from a local folder. Yesterday, you updated Process.docx in the local folder. What will occur when you chat in the notebook?

- A. The chat will reference both versions of Process.docx.
- B. The chat will reference the most recent version of Process.docx.
- C. The chat will reference only the original version of Process.docx.

Answer: C

Explanation:

Microsoft 365 Copilot notebooks use the version of a file that was uploaded or attached at the time it was added to the notebook. When a document such as Process.docx is added from a local folder, Copilot references that uploaded snapshot of the file. If the file is later modified locally, the notebook does not automatically sync or refresh with the updated local version unless the updated file is re-uploaded. Microsoft guidance on grounding and file references explains that Copilot works with the specific content stored in Microsoft 365 or the attached artifact within the notebook session. Since the updated version remains in the local folder and was not reattached, Copilot continues to use the originally added version. Therefore, during subsequent chats in the notebook, Copilot references only the original uploaded version of Process.docx.

10.You are creating a custom agent in the Microsoft 365 Copilot app for the marketing team at your company. The agent will be used to produce marketing collateral, including copy, logos, and artwork. What should you add to the agent? More than one answer choice may achieve the goal. Select the BEST answer.

- A. a template
- B. a suggested prompt
- C. image generator
- D. code interpreter

Answer: C

Explanation:

When building a custom agent in Microsoft 365 Copilot for marketing use cases, the required capabilities must align with the intended outputs. Marketing collateral includes written copy as well as visual assets such as logos and artwork. According to Microsoft AI Business Professional documentation, generative AI solutions that produce visual creative assets require integrated image generation capabilities powered by multimodal AI models.

Option C is correct because an image generator enables the agent to create visual marketing materials such as logos, artwork, and design elements. While templates and suggested prompts can improve usability and consistency, they do not provide the underlying capability to generate images. A code interpreter is designed for data analysis, calculations, or technical scripting tasks and is not relevant to creative marketing asset production.

Therefore, to fulfill the requirement of producing both textual and visual marketing collateral, the most essential addition to the custom agent is an image generator.

11.A colleague from another company shares a link to a prompt.

When you select the link, you receive the following response: "Prompt not found. Sorry, it looks like the prompt is no longer available."

What is a possible cause of the response?

- A. The prompt is a scheduled prompt.
- B. The prompt contains a reference to a file that you do NOT have access to.
- C. The prompt is outdated.
- D. The prompt contains a file that has a sensitivity label applied.
- E. The prompt is outside of your organization.

Answer: E

Explanation:

Microsoft 365 Copilot operates within the security, compliance, and identity boundaries of a Microsoft 365 tenant. Shared prompts, prompt links, and Copilot artifacts are governed by organizational access controls and tenant isolation. If a prompt is created and shared from outside your organization, cross-tenant access may not be supported depending on the sharing configuration and administrative policies. When a user attempts to open a prompt that resides in another organization's tenant without proper cross-tenant sharing permissions, Copilot cannot locate or validate the resource within the user's own environment. As a result, the system displays a "Prompt not found" message.

Option B would typically result in an access or permissions error rather than the prompt being unavailable entirely. Sensitivity labels and scheduled prompts do not inherently cause a "not found" error. Therefore, the most likely cause is that the prompt exists outside your organization's tenant boundary and is not accessible to you.

12. You use Microsoft 365 Copilot.

You need to delete all your conversations by using the least amount of effort.

What is the best approach to achieve the goal? More than one answer choice may achieve the goal.

Select the BEST answer.

- A. the Microsoft 365 Copilot web app
- B. the My Account portal in Microsoft 365
- C. the Microsoft 365 Copilot desktop app
- D. the Settings app in Windows 11

Answer: B

Explanation:

Microsoft provides centralized activity management controls through the My Account portal, which allows users to manage privacy settings, activity history, and data associated with Microsoft 365 services, including Copilot. When the requirement is to delete all conversations with minimal effort, the most efficient method is to use the account-level activity management tools rather than deleting conversations individually.

The My Account portal enables bulk management of Copilot activity data, allowing users to clear conversation history in a consolidated manner. This approach aligns with Microsoft's privacy-by-design framework, giving users control over their AI-generated interaction history without requiring administrative intervention.

Using the Copilot web or desktop app would typically require manually deleting conversations one at a time, increasing effort. The Windows 11 Settings app is unrelated to Microsoft 365 Copilot data management.

Therefore, to delete all Copilot conversations efficiently and with the least amount of effort, the correct approach is to use the My Account portal in Microsoft 365.

13.HOTSPOT

You create an agent in the Microsoft 365 Copilot app by using a template.

For each of the following statements, select Yes if the statement is true. Otherwise, select No. NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
You can share the agent with external users.	☐	☐
You can choose which knowledge sources the agent can use.	☐	☐
You can share the agent with users in your organization.	☐	☐

Answer:**Answer Area**

Statements	Yes	No
You can share the agent with external users.	☐	☒
You can choose which knowledge sources the agent can use.	☒	☐
You can share the agent with users in your organization.	☒	☐

Explanation:

When creating an agent in the Microsoft 365 Copilot app using a template, administrators or authorized users can configure specific behaviors and knowledge sources for the agent. Therefore, it is correct that you can choose which knowledge sources the agent can use. This ensures proper grounding in approved Microsoft 365 data such as SharePoint sites, OneDrive folders, or other organizational repositories. Controlling knowledge sources supports responsible AI principles, including data security, relevance, and compliance.

Agents created within Microsoft 365 are designed primarily for internal organizational use. As a result, sharing the agent with users inside the organization is supported, enabling collaboration and productivity improvements across teams.

However, sharing the agent with external users is not supported by default. External sharing would introduce security and compliance risks, so Microsoft enforces tenant-level boundaries to protect enterprise data.

These capabilities reflect best practices in managing AI prompts and agents securely within enterprise environments.

14.HOTSPOT

Select the answer that correctly completes the sentence.

Answer Area

You are creating an agent in the Microsoft 365 Copilot app.
The agent persona must be warm and friendly.
To set the persona, you should modify the

Answer:

Answer Area

You are creating an agent in the Microsoft 365 Copilot app.
The agent persona must be warm and friendly.
To set the persona, you should modify the

Explanation:

The correct answer is instructions because an agent's persona—such as being warm, friendly, formal, or analytical—is defined through its behavioral and communication guidance. In Microsoft 365 Copilot, the Instructions field controls how the agent responds, including tone, style, personality, response structure, and interaction patterns.

The description typically explains what the agent does, not how it communicates. Capabilities define what tasks the agent can perform, such as summarizing documents or analyzing data. Suggested prompts provide example user queries but do not control the agent's personality or communication style. To establish a warm and friendly persona, the instructions should explicitly state guidance such as: "Respond in a supportive, conversational tone. Use clear and positive language. Be encouraging and approachable." This ensures consistent tone across all interactions.

Defining persona through instructions reflects prompt engineering best practices in generative AI, enabling predictable behavior, improved user experience, and alignment with organizational communication standards within Microsoft 365 Copilot environments.

15.HOTSPOT

What are two limitations of prompt scheduling in Microsoft 365 Copilot? To answer, select the appropriate options in the answer area. NOTE: Each correct selection is worth one point.

Answer Area

You can schedule the prompt to run as often as:

The maximum number of times that a scheduled prompt can run is:

Answer:

Answer Area

You can schedule the prompt to run as often as:

The maximum number of times that a scheduled prompt can run is:

Explanation:

Prompt scheduling in Microsoft 365 Copilot enables users to automate recurring AI-driven tasks such as generating reports, summaries, or updates. However, there are defined operational limits to ensure system performance, responsible AI usage, and governance compliance.

First, the most frequent interval at which a prompt can be scheduled is once per day. Scheduling more frequently, such as hourly, is not supported. This limitation prevents excessive automated execution that could strain system resources or generate unnecessary redundant outputs.

Second, a scheduled prompt has a maximum execution limit of 15 times. After reaching this threshold, the schedule must be recreated if further automation is required. This control ensures users periodically review and validate automated prompts for relevance, accuracy, and business alignment.

These constraints reflect Microsoft's enterprise AI governance strategy: balancing productivity automation with performance optimization, cost control, compliance oversight, and responsible AI lifecycle management within Microsoft 365 Copilot environments.

16.You are creating a custom analytics agent in the Microsoft 365 Copilot app. The agent will use Microsoft Excel files that contain sales data as knowledge.

You need to ensure that the agent can create visualizations, perform mathematical operations, create aggregations, and analyze the data in the files.

What should you add to the agent?

- A. code interpreter
- B. image generator
- C. a suggested prompt
- D. a template

Answer: A

Explanation:

When building a custom analytics agent in Microsoft 365 Copilot that must process structured data from Excel files, advanced analytical capabilities are required. According to Microsoft AI Business Professional guidance, tasks such as performing mathematical calculations, generating aggregations, creating charts, and conducting structured data analysis require programmatic execution capabilities rather than simple text generation.

A code interpreter enables the agent to run Python-based analytical operations in a secure execution environment. This allows the agent to manipulate datasets, compute totals and averages, perform grouping and filtering, and generate visualizations such as bar charts or line graphs based on the Excel data. The interpreter bridges the gap between natural language instructions and executable analytical logic.

An image generator is designed for creative visual content and is unrelated to structured data analytics. Suggested prompts and templates improve usability and consistency but do not provide computational or visualization capabilities.

Therefore, to enable mathematical operations, aggregation, data analysis, and visualization of Excel sales data, the correct component to add to the agent is a code interpreter.

17.HOTSPOT

You have a Microsoft 365 subscription.

You do NOT have a Microsoft 365 Copilot license.

For each of the following statements, select Yes if the statement is true. Otherwise, select No. NOTE:

Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Microsoft 365 Copilot Chat lets you upload documents from your local computer.	☐	☐
Microsoft 365 Copilot Chat is included with Microsoft 365 Business Standard.	☐	☐
Microsoft 365 Copilot Chat lets you create and use agents that can access Microsoft SharePoint folders.	☐	☐

Answer:**Answer Area**

Statements	Yes	No
Microsoft 365 Copilot Chat lets you upload documents from your local computer.	☒	☐
Microsoft 365 Copilot Chat is included with Microsoft 365 Business Standard.	☒	☐
Microsoft 365 Copilot Chat lets you create and use agents that can access Microsoft SharePoint folders.	☐	☒

Explanation:

Microsoft 365 Copilot Chat is included at no additional cost for users with qualifying Microsoft 365 subscriptions such as Business Basic, Business Standard, Business Premium, E3, and E5. Therefore,

users without a Microsoft 365 Copilot add-on license can still access Copilot Chat.

Copilot Chat allows users to upload documents from their local device within a session for summarization, analysis, and drafting assistance. However, advanced enterprise-integrated features—such as creating agents that access organizational SharePoint folders—require a Microsoft 365 Copilot license.

Agent creation and enterprise data grounding leverage Microsoft Graph integration and are considered premium Copilot capabilities tied to licensed Copilot services.

This distinction reflects Microsoft's licensing model: baseline AI chat access is included with qualifying subscriptions, while deep Microsoft 365 app integration and enterprise data agents require the additional Copilot license.

18.You use Microsoft 365 Copilot to generate a training plan.

You need to check if there are any existing training plans in your organization that are similar to the new training plan.

What should you use in Copilot?

- A. Search
- B. Designer
- C. Apps
- D. Pages

Answer: A

Explanation:

Microsoft 365 Copilot integrates with Microsoft Search to help users discover relevant content across their organization's Microsoft 365 data estate, including SharePoint, OneDrive, Teams, and Exchange. When the objective is to determine whether similar training plans already exist, the appropriate action is to perform a search across organizational content.

Using Search allows Copilot to query indexed enterprise documents and return files, plans, or related materials that the user has permission to access. This supports content reuse, avoids duplication of work, and aligns with Microsoft's guidance on leveraging organizational knowledge efficiently.

Designer is focused on visual content creation, Apps provides access to Microsoft 365 applications, and Pages is used for creating and organizing content within Copilot. None of these options are intended for discovering existing documents across the tenant.

Therefore, to identify similar existing training plans within your organization, the correct tool to use in Copilot is Search.

19.You are discussing Microsoft 365 Copilot with a colleague. The colleague asks which data Copilot uses to answer questions when using the Work scope.

What should you tell your colleague?

- A. Copilot provides responses based only on the general knowledge that Copilot was trained on.
- B. Copilot provides responses based on all the data in your organization's Microsoft 365 environment and the general knowledge that Copilot was trained on.
- C. Copilot provides responses based only on data that the user can access and the general knowledge that Copilot was trained on.
- D. Copilot provides responses based only on data that the user can access.

Answer: C

Explanation:

Microsoft 365 Copilot operates within two primary knowledge boundaries: its foundational large language model training data and the organizational data available within the Microsoft 365 tenant. However, Copilot strictly enforces Microsoft's security and compliance model, meaning it only retrieves and uses data that the signed-in user is authorized to access.

When using the Work scope, Copilot combines the general knowledge it was trained on with organizational data such as documents, emails, chats, calendars, and files stored in Microsoft 365. Importantly, Copilot respects role-based access control and existing permissions. It does not surface information from content the user does not have access to.

Option A is incomplete because Work scope includes organizational data.

Option B is incorrect because Copilot does not access all tenant data indiscriminately; it is permission-scoped.

Option D is incomplete because Copilot also leverages its general training knowledge.

Therefore, the correct explanation is that Copilot provides responses based only on data the user can access, combined with its general training knowledge.

20.HOTSPOT

For each of the following statements, select Yes if the statement is true. Otherwise, select No. NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Prompt injection can cause data exposure and unintended system behavior.	☐	☐
Prompt injection can be used to embed malicious or harmful instructions.	☐	☐
Prompt injection is a security vulnerability unique to generative AI systems that interpret and respond to natural language inputs.	☐	☐

Answer:**Answer Area**

Statements	Yes	No
Prompt injection can cause data exposure and unintended system behavior.	☒	☐
Prompt injection can be used to embed malicious or harmful instructions.	☒	☐
Prompt injection is a security vulnerability unique to generative AI systems that interpret and respond to natural language inputs.	☒	☐

Explanation:

Prompt injection is a generative AI security risk where an attacker inserts instructions (often hidden in text, documents, webpages, or user inputs) to override or manipulate the assistant's intended behavior. This can lead to unintended actions such as ignoring policy controls, producing unsafe outputs, or attempting to reveal sensitive information. Because generative AI systems follow natural-language instructions, they can be socially engineered to prioritize malicious content unless safeguards are in

place. This is why prompt injection can cause data exposure (for example, attempting to extract confidential content from grounded sources) and can also embed harmful instructions that redirect the model's behavior. In enterprise settings like Microsoft 365 Copilot, mitigations include grounding boundaries, permission trimming, content filtering, and instruction hierarchy (system policies over user instructions). From a business governance perspective, users should treat untrusted inputs (emails, documents, web text) as potentially hostile and apply least-privilege access and validation when using AI outputs in decision-making.

21.HOTSPOT

For each of the following statements, select Yes if the statement is true. Otherwise, select No. NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Microsoft 365 Copilot uses contextual information from your organization to suggest prompts.	☐	☐
Microsoft 365 Copilot can use contextual information from your organization to train the large language model. (LLM).	☐	☐
Microsoft 365 Copilot uses contextual information from your organization to augment a prompt, before sending the prompt to the large language model (LLM).	☐	☐

Answer:

Answer Area

Statements	Yes	No
Microsoft 365 Copilot uses contextual information from your organization to suggest prompts.	☒	☐
Microsoft 365 Copilot can use contextual information from your organization to train the large language model. (LLM).	☐	☒
Microsoft 365 Copilot uses contextual information from your organization to augment a prompt, before sending the prompt to the large language model (LLM).	☒	☐

Explanation:

Microsoft 365 Copilot is designed to be helpful by using work context—for example, the files you have access to, recent activity, meetings, emails, and SharePoint/OneDrive content—to suggest relevant prompts and help you start tasks faster. It also uses this context to augment your prompt before it is sent to the LLM. This is the grounding approach (often described as retrieval-augmented generation): Copilot retrieves relevant organizational content you're permitted to access and adds it as supporting context so responses are accurate and business-relevant. However, Microsoft 365 Copilot does not use your organization's contextual data to train the underlying foundation model. That separation is critical for enterprise privacy and compliance: your prompts, responses, and tenant data are used to generate the answer for your session and permissions, but are not used to improve or retrain the base LLM. This approach supports responsible AI, protects confidential business information, and ensures outputs respect access controls.

22.You ask Microsoft 365 Copilot to create a report based on information from the web. You verify the

response and discover that some information is fictional.

What is this an example of?

- A. deepfake
- B. fabrication
- C. overreliance
- D. prompt injection
- E. bias

Answer: B

Explanation:

This scenario is an example of fabrication, which is commonly referred to in generative AI contexts as a hallucination. Fabrication occurs when an AI system generates information that appears credible but is factually incorrect, invented, or unsupported by verifiable sources.

According to Microsoft AI Business Professional guidance, large language models predict text based on patterns learned during training. They do not “know” facts in the human sense. As a result, when asked to generate reports using web-based information, the model may produce plausible-sounding but fictional details if sufficient grounding or reliable sources are not provided.

Deepfake refers specifically to synthetic media such as manipulated images, audio, or video.

Overreliance describes a human behavior risk where users trust AI outputs without verification. Prompt injection is a malicious technique designed to manipulate model behavior. Bias refers to systematic unfairness in outputs.

In this case, the presence of fictional information in the generated report directly aligns with fabrication, making option B the correct answer.

23.HOTSPOT

For each of the following statements, select Yes if the statement is true. Otherwise, select No. NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
When you submit the same prompt to Microsoft 365 Copilot multiple times, and you are grounded in the web, the response will always be identical.	☐	☐
When you submit the same prompt to Microsoft 365 Copilot multiple times, and you are grounded in your own data, the response will always be identical.	☐	☐
When you submit the same prompt to Microsoft 365 Copilot multiple times, and you are grounded only in the model's knowledge, the response will always be identical.	☐	☐

Answer:

Answer Area

Statements	Yes	No
When you submit the same prompt to Microsoft 365 Copilot multiple times, and you are grounded in the web, the response will always be identical.	☐	☒
When you submit the same prompt to Microsoft 365 Copilot multiple times, and you are grounded in your own data, the response will always be identical.	☐	☒
When you submit the same prompt to Microsoft 365 Copilot multiple times, and you are grounded only in the model's knowledge, the response will always be identical.	☐	☒

Explanation:

All three statements are false because generative AI responses are not guaranteed to be identical even when the prompt is the same. First, when grounded in the web, results can vary due to changing web content, different retrieved sources, or differences in how information is summarized at run time. Second, when grounded in your organization's data, responses can change based on updates to files, emails, meetings, permissions, or which specific items Copilot retrieves as the most relevant context at that moment. Third, even when relying only on the model's general knowledge, large language models are probabilistic: they may choose different wording, structure, examples, or emphasis across runs, especially when temperature/decoding settings and internal routing differ. In business scenarios, this means Copilot outputs should be treated as drafts that may require validation, and repeatability should be improved by adding precise constraints (cite specific sources, use fixed formats, specify exact sections, and request verbatim quotes where appropriate).

24. You are a project coordinator for a small consulting firm.

You are responsible for tracking client communications, managing project timelines, and preparing weekly status updates for internal stakeholders.

You have a Microsoft 365 Copilot license.

You create an agent to help you monitor project milestones, follow up on client emails, and generate weekly summary reports.

With whom can you share the agent?

- A. only Microsoft Teams channel members
- B. any person who has a valid email address
- C. the people in your organization and people that have personal Microsoft accounts
- D. only the people in your organization

Answer: D

Explanation:

Microsoft 365 Copilot agents operate within the security, compliance, and identity boundaries of a Microsoft 365 tenant. Custom agents created in the Microsoft 365 Copilot app are governed by organizational policies, role-based access control, and Microsoft Entra ID authentication.

According to Microsoft AI Business Professional guidance, Copilot agents are designed for enterprise use and are shared within the organization unless administrators configure broader sharing capabilities. External sharing with personal Microsoft accounts or arbitrary email addresses is not supported by default due to security, data protection, and compliance requirements.

Because the agent in this scenario interacts with organizational data such as client emails, project milestones, and internal reports, access must remain restricted to authenticated users within the same tenant. This ensures that sensitive business information remains protected and that data access respects existing permissions.

Therefore, the agent can be shared only with people in your organization, making option D the correct answer.

25. HOTSPOT

Select the answer that correctly completes the sentence.

Answer Area

▼

- The Common Data Model
- Enterprise data protection (EDP)
- Sensitivity labels
- Zero Trust

in Microsoft 365 Copilot ensures that business data stays within a Microsoft 365 tenant and is **NOT** used to train AI models.

Answer:

Answer Area

Enterprise data protection ▼

in Microsoft 365 Copilot ensures that business data stays within a Microsoft 365 tenant and is **NOT** used to train AI models.

Explanation:

Enterprise data protection (EDP) (often referred to as commercial data protection) is the capability that ensures Microsoft 365 Copilot handles organizational data under enterprise security and privacy guarantees. With EDP, Copilot processes prompts and responses within the customer's Microsoft 365 boundary, respecting tenant isolation and identity-based access controls. This means Copilot only retrieves and uses data that the signed-in user is permitted to access, and the data remains governed by Microsoft 365 compliance features (such as retention, eDiscovery, audit, and Purview controls). Critically, EDP ensures that your organization's prompts and the retrieved business content are not used to train the underlying AI foundation models. This is essential for protecting confidential business information and meeting regulatory and contractual requirements. The other options (Common Data Model, sensitivity labels, and Zero Trust) support data structure, classification, and security posture, but they do not specifically represent the Copilot guarantee that tenant data stays protected and is not used for model training.

26.HOTSPOT

Select the answer that correctly completes the sentence.

Answer Area

When you are creating an agent in Microsoft 365 Copilot, you can leverage generative AI to build the agent by using

▼

- the Configure tab
- a Copilot notebook
- a Copilot page
- the Describe tab

Answer:

Answer Area

When you are creating an agent in Microsoft 365 Copilot, you can leverage generative AI to build the agent by using

the Describe tab ▼

Explanation:

The Describe tab is where you leverage generative AI to help build an agent by describing what you want the agent to do in natural language. Instead of manually configuring everything first, you provide the agent's purpose, target users, tone, and the tasks it should perform (for example: "Create an onboarding agent that answers HR policy questions in a friendly tone and references SharePoint policies"). Copilot then uses that description to propose an initial agent setup—such as suggested behaviors, starter prompts, and structure—accelerating agent creation and improving consistency. By

contrast, the Configure tab is typically used to fine-tune and finalize settings (such as knowledge sources, actions, and other parameters) after the agent concept is established. A Copilot notebook or Copilot page can help organize content and outputs, but they are not the primary place where generative AI “builds” the agent definition. Using the Describe tab reflects best practice: start with clear intent and constraints, then refine configuration for governance, accuracy, and usability.

27.HOTSPOT

While using Microsoft 365 Copilot, content is returned from a website.

You need to verify the exact search query used to find the website.

What should you use? To answer, select the appropriate options in the answer area.

Answer Area

Today

Give me the current temperature in Ghana. Don't be verbose. Just the temp.

28.You sign in to the Microsoft 365 Copilot app by using your work account as shown in the following exhibit

A colleague tells you that when they open the Microsoft 365 Copilot app, they have access to the Researcher agent. You need to access to the Researcher agent.

What should you do?

- A. From Microsoft Edge, use your work account to sign in to <https://copilot.microsoft.com>.
- B. Select Explore agents and then search for Researcher.
- C. Sign in to the Copilot app by using a personal account
- D. Request a Microsoft 365 Copilot license from an administrator.

Answer: B

Explanation:

In Microsoft 365 Copilot, agents such as Researcher are accessed through the Agents experience within the Copilot app. If the user interface does not immediately display a specific agent, the correct action is to browse or search the available agents catalog. The exhibit shows the left navigation pane with an Explore agents option.

According to Microsoft AI Business Professional guidance, built-in and custom agents can be discovered and enabled through the Explore agents section. If the user already has the appropriate Copilot license and is signed in with their work account, there is no need to switch accounts or request another license. Signing in through a browser does not change feature availability, and using a personal account would remove access to organizational features. Therefore, to access the Researcher agent, you should select Explore agents and search for Researcher.

29. You sign in to the Microsoft 365 Copilot app by using your work account as shown in the exhibit. A colleague tells you that when they open the Microsoft 365 Copilot app, they have access to the Researcher agent. You need to access the Researcher agent.

What should you do?

- A. From Microsoft Edge, use your work account to sign in to <https://copilot.microsoft.com>.
- B. Select Explore agents and then search for Researcher.
- C. Sign in to the Copilot app by using a personal account.
- D. Request a Microsoft 365 Copilot license from an administrator.

Answer: B

Explanation:

In Microsoft 365 Copilot, agents such as Researcher are accessed through the Agents experience within the Copilot app. If the user interface does not immediately display a specific agent, the correct action is to browse or search the available agents catalog. The exhibit shows the left navigation pane with an Explore agents option.

According to Microsoft AI Business Professional guidance, built-in and custom agents can be discovered and enabled through the Explore agents section. If the user already has the appropriate Copilot license and is signed in with their work account, there is no need to switch accounts or request another license. Signing in through a browser does not change feature availability, and using a personal account would remove access to organizational features. Therefore, to access the Researcher agent, you should select Explore agents and search for Researcher.

30. You receive the following response to a prompt: "Sorry, it looks like I can't respond to this. Let's try a different topic."

What is a possible cause of the response?

- A. The prompt is too vague to elicit a response.
- B. The prompt contains language that violates safety guidelines.
- C. The prompt contains more than five requests.
- D. The prompt is larger than the allowed context window.

Answer: B

Explanation:

Microsoft 365 Copilot follows Microsoft's Responsible AI principles and enforces strict content safety policies. When a prompt violates safety guidelines—such as containing harmful, abusive, illegal, or restricted content—the system may refuse to generate a response. The refusal message shown is consistent with safety filtering behavior.

Generative AI systems include moderation layers that evaluate prompts before generating output. If the prompt is classified as unsafe or non-compliant with policy, Copilot blocks the request and encourages the user to try a different topic.

A vague prompt typically results in a generic or clarifying response rather than a refusal. There is no fixed limit of five requests per prompt. Exceeding the context window usually results in truncation or processing errors, not a safety-based refusal message.

Therefore, the most likely cause of the response is that the prompt contains language that violates safety guidelines.

31. You use the Researcher agent in Microsoft 365 Copilot to generate a report.

What can you use to verify whether the report was generated by using valid sources?

- A. citations
- B. instructions
- C. memory
- D. capabilities

Answer: A

Explanation:

The Researcher agent in Microsoft 365 Copilot is designed to gather and synthesize information from web and organizational sources. To support transparency and trust, Copilot provides citations alongside generated content when external or referenced material is used.

Citations allow users to review the original sources that informed the generated report. This aligns with Microsoft's Responsible AI commitment to transparency and verifiability. By selecting or reviewing citations, users can confirm that the information originates from credible and relevant references rather than unsupported model-generated text.

Instructions define how the agent behaves but do not validate source authenticity. Memory refers to conversational context retention and does not confirm source validity. Capabilities describe what the agent can do, not whether its output is grounded in legitimate sources.

Therefore, to verify that a report generated by the Researcher agent uses valid sources, you should review the citations.

32.HOTSPOT

Select the answer that correctly completes the sentence.

Answer Area

▼ Microsoft Defender for Cloud Microsoft Entra ID Microsoft Intune Microsoft Purview	enables organizations to apply governance policies to conversations generated by using Microsoft 365 Copilot.
--	---

Answer:

Answer Area

Microsoft Purview ▼	enables organizations to apply governance policies to conversations generated by using Microsoft 365 Copilot.
---	---

Explanation:

Microsoft Purview is the correct choice because it is Microsoft's unified compliance and data governance solution that helps organizations apply and enforce policies across Microsoft 365 content—including Copilot-related interactions where those interactions are captured in services such as Microsoft 365 audit, eDiscovery, and Purview compliance experiences. Purview supports capabilities such as data loss prevention (DLP), retention, eDiscovery, audit, and sensitivity labeling so organizations can manage and govern data and AI-assisted content in line with regulatory and internal requirements. In contrast, Microsoft Entra ID focuses on identity and access management, Intune focuses on device and

application management, and Defender for Cloud focuses on cloud security posture management. Governance policies for Copilot-generated conversations and associated compliance controls align most directly with Purview, which is designed to manage information protection and compliance across the Microsoft 365 environment.

33.HOTSPOT

Select the answer that correctly completes the sentence.

Answer Area

Overreliance is a common risk associated with generative AI, where

- users exploit vulnerabilities to elicit unauthorized behavior.
- the model is tricked into exposing confidential information.
- the model generates misleading, inaccurate, or irrelevant content.
- users accept the AI-generated output without verifying its accuracy

Answer:

Answer Area

Overreliance is a common risk associated with generative AI, where

users accept the AI-generated output without verifying its accuracy.

34.You join an internal Microsoft Teams meeting late and want to catch up on what you missed. The meeting is being recorded. You need to summarize the portion of the meeting that you missed as soon as possible.

What is the best approach to achieve the goal? More than one answer choice may achieve the goal.

Select the BEST answer.

- A. From the Teams app, ask Copilot in Teams to summarize what you missed so far.
- B. From the meeting, read the transcript.
- C. From the Microsoft 365 Copilot app, ask Copilot to tell you what you missed.
- D. From the Teams app, view the intelligent recap.

Answer: A

Explanation:

Microsoft 365 Copilot in Teams is designed to provide real-time meeting assistance, including summarizing discussions, identifying key decisions, and highlighting action items. When joining a meeting late, the most efficient and immediate method to catch up is to directly prompt Copilot within the Teams meeting experience.

Option A is the best answer because Copilot in Teams can summarize what has occurred so far during the live meeting. It leverages the meeting transcript, speaker attribution, and contextual signals to generate a concise, structured summary in real time. This minimizes delay and provides actionable insights instantly.

Reading the transcript (Option B) would require manual review and is not the fastest method. Intelligent recap (Option D) is typically available after the meeting concludes and processes recording data. Asking Copilot from the separate Microsoft 365 Copilot app (Option C) may not provide immediate, in-meeting contextual awareness.

Therefore, the fastest and most effective approach is to ask Copilot in Teams to summarize what you missed.

35.HOTSPOT

For each of the following statements, select Yes if the statement is true. Otherwise, select No. NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Microsoft 365 Copilot can surface data from Microsoft Teams chats.	☐	☐
Microsoft 365 Copilot can schedule, draft, and send emails based on certain conditions.	☐	☐
Microsoft 365 Copilot can summarize, draft, and answer questions about content from Microsoft Teams meetings.	☐	☐

Answer:

Answer Area

Statements	Yes	No
Microsoft 365 Copilot can surface data from Microsoft Teams chats.	☒	☐
Microsoft 365 Copilot can schedule, draft, and send emails based on certain conditions.	☐	☒
Microsoft 365 Copilot can summarize, draft, and answer questions about content from Microsoft Teams meetings.	☒	☐

Explanation:

Microsoft 365 Copilot can use Microsoft Graph-grounded data (based on the user's permissions) to help users work with Microsoft 365 content. This includes surfacing and summarizing information from Teams chats, so statement 1 is true. Copilot can also summarize and generate content related to Teams meetings (for example, meeting recap details, key discussion points, and follow-up actions when meeting artifacts such as transcript/notes are available), and it can answer questions and draft related content—so statement 3 is true.

Statement 2 is false because, while Copilot can draft emails and help prepare messages, it does not independently schedule and send emails automatically “based on conditions” as a native Copilot function. Conditional sending is typically handled through workflow automation tools (for example, Power Automate) and still requires appropriate configuration, permissions, and governance. In enterprise environments, this separation helps reduce risk by ensuring that automated outbound communication remains controlled, auditable, and compliant.

36. You are using Microsoft 365 Copilot to plan a trip and have asked Copilot to remember several details about the trip.

You cancel the trip plans.

You need to ensure that Copilot forgets the details.

What should you do?

- A. From the My Account portal, delete the Copilot activity history.
- B. From Copilot delete custom instructions.
- C. From Copilot delete memories.
- D. From Copilot delete all the conversation about the trip.

Answer: C

Explanation:

Microsoft 365 Copilot includes a memory capability that allows it to retain user-provided preferences or details across interactions when explicitly instructed to remember them. These stored details are referred to as memories and are separate from standard conversation history.

If you previously asked Copilot to remember specific trip-related details, those details are stored as structured memory items. Simply deleting the conversation does not necessarily remove stored memory entries. Likewise, deleting activity history through the My Account portal removes conversation records but does not directly manage structured Copilot memories. Custom instructions define persistent behavioral preferences and are unrelated to trip-specific stored data.

To ensure Copilot no longer retains those trip details, you must delete the stored memories directly within Copilot. Microsoft documentation explains that users can view and manage saved memories and remove them individually to control what Copilot retains.

Therefore, the correct action to ensure Copilot forgets the trip details is to delete the memories.

37.HOTSPOT

You are a business user who uses Microsoft 365 apps and services, including Microsoft Teams. You have a work account.

You want to use Microsoft 365 Copilot to help with meetings.

For each of the following statements, select Yes if the statement is true. Otherwise, select No. NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Copilot can answer questions about Teams meetings that you are NOT invited to.	☐	☐
Copilot can provide summaries and answer questions about chat messages, channel posts, and Teams meetings.	☐	☐
Copilot can provide a summary of all the upcoming Teams meeting details you are invited to next week.	☐	☐

Answer:

Answer Area

Statements	Yes	No
Copilot can answer questions about Teams meetings that you are NOT invited to.	☐	☒
Copilot can provide summaries and answer questions about chat messages, channel posts, and Teams meetings.	☒	☐
Copilot can provide a summary of all the upcoming Teams meeting details you are invited to next week.	☒	☐

Explanation:

Microsoft 365 Copilot respects Microsoft 365 permissions ("permission trimming"). This means it can only access and summarize content you are authorized to view. Therefore, Copilot cannot answer questions about Teams meetings you are not invited to (and otherwise don't have access to), making statement 1

No.

Copilot can summarize and answer questions about Teams artifacts you do have access to—such as chat messages, channel posts, and meeting content (for example, transcripts, notes, recordings, and meeting recap details when available). That makes statement 2 Yes.

Copilot can also help you prepare for your schedule by summarizing upcoming meetings you're invited to, using calendar and meeting context (subject, time, participants, related emails/files, and available agenda/notes). This supports planning and prioritization for the week ahead, so statement 3 is Yes.

38. You plan to summarize a proposal for a partnership between your company and another company. You need to use Microsoft 365 Copilot to summarize the information in the proposal as a bulleted list of three to five key points for a project kickoff meeting. Each bullet point must be concise and simply worded.

Which two details should you include in the prompt?

- A. profiles of both companies generated by using the Researcher agent
- B. concise instructions for what to do with the proposal
- C. a list of contact details for key stakeholders of the partnership
- D. a specific knowledge source to ground the response

Answer: B, D

Explanation:

Effective prompting in Microsoft 365 Copilot requires two critical components: clear instructions and grounding in authoritative content. Microsoft guidance emphasizes that prompts should explicitly state the desired output format, tone, length, and purpose. In this case, specifying “a bulleted list of three to five concise, simply worded key points” represents concise instructions, making option B essential. Additionally, grounding the response in a specific knowledge source—such as attaching or referencing the proposal document—ensures factual accuracy and reduces hallucination.

Option D ensures Copilot uses the actual proposal content rather than relying on generalized model knowledge.

Profiles and stakeholder contact details are unrelated to summarization requirements. Therefore, the correct selections are B and D.

39. In a Microsoft 365 Copilot conversation, you generate a report, and then edit the report in a page. You need to collaborate with a colleague on the report.

What are two ways to achieve the goal?

- A. @mention the colleague in the page.
- B. Add the page to a notebook.
- C. Open the page in Microsoft Word.
- D. Share the page link.

Answer: A, D

Explanation:

Microsoft 365 Copilot Pages supports collaboration similarly to other Microsoft 365 documents.

Collaboration requires notifying or granting access to colleagues.

Using @mentions within the page (Option A) directly notifies the colleague and facilitates collaborative engagement. Sharing the page link (Option D) allows others to access and edit the content according to permissions. These two methods provide complete collaboration workflows.

Adding the page to a notebook does not grant collaborative access. Opening the page in Word changes the editing surface but does not inherently enable collaboration unless shared.

Therefore, the correct answers are A and D.

40.You are using Microsoft 365 Copilot to enhance your productivity in Microsoft Word.

Which two tasks can you achieve by using Copilot in Word?

- A. Insert a table of contents based on the headings in your document.
- B. Insert a custom watermark that has specific text and formatting.
- C. Generate a summary of the key points in your document.
- D. Customize the page margins to match your company's document standards.

Answer: A, C

Explanation:

Copilot in Word assists with content generation, summarization, rewriting, and structural organization. It can analyze document headings and insert a table of contents based on structured heading styles, supporting document navigation. It can also generate summaries of key points, which aligns directly with generative AI text analysis capabilities.

Custom watermark formatting and precise page margin configuration are traditional Word formatting functions and are not core generative AI capabilities of Copilot.

Therefore, the correct answers are A and C.

41.You are a medical researcher.

You need to ensure that Microsoft 365 Copilot responds to you in a professional manner that is appropriate to your field.

What is the best approach to achieve the goal?

- A. In the conversation, attach an example to your prompts.
- B. From Settings, configure Custom instructions.
- C. In the conversation, create a sample prompt and save it to the Copilot Prompt Gallery.
- D. From Settings, configure Copilot Memory.

Answer: B

Explanation:

Custom instructions allow users to define persistent preferences for tone, style, and response behavior across conversations. Microsoft documentation explains that Custom instructions help tailor Copilot responses to professional roles, communication styles, and domain expectations.

For a medical researcher requiring consistently professional, field-appropriate responses, configuring Custom instructions in Settings ensures that Copilot maintains the desired tone and terminology in future interactions.

Attaching examples influences only a single conversation. Saving prompts to the Prompt Gallery aids reuse but does not enforce tone globally. Copilot Memory stores factual preferences but is not intended for style configuration.

Therefore, the best and most comprehensive approach is to configure Custom instructions in Settings.

42.HOTSPOT

For each of the following statements, select Yes if the statement is true. Otherwise, select No. NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
You can chat with the Analyst agent from within an existing Microsoft 365 Copilot conversation.	☐	☐
You can chat with the Researcher agent from within an existing Microsoft 365 Copilot conversation.	☐	☐
You can chat with multiple agents concurrently within an existing Microsoft 365 Copilot conversation.	☐	☐

Answer:

Answer Area

Statements	Yes	No
You can chat with the Analyst agent from within an existing Microsoft 365 Copilot conversation.	☒	☐
You can chat with the Researcher agent from within an existing Microsoft 365 Copilot conversation.	☒	☐
You can chat with multiple agents concurrently within an existing Microsoft 365 Copilot conversation.	☒	☐

43.HOTSPOT

For each of the following statements, select Yes if the statement is true. Otherwise, select No. NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
Microsoft 365 Copilot is trained on your organization's business data.	☐	☐
Microsoft 365 Copilot can summarize emails in mailboxes that were shared with you.	☐	☐
Microsoft 365 Copilot leverages the security framework defined in Microsoft 365 to provide you with access to emails, documents, and other enterprise data.	☐	☐

Answer:

Answer Area

Statements	Yes	No
Microsoft 365 Copilot is trained on your organization's business data.	☐	☒
Microsoft 365 Copilot can summarize emails in mailboxes that were shared with you.	☒	☐
Microsoft 365 Copilot leverages the security framework defined in Microsoft 365 to provide you with access to emails, documents, and other enterprise data.	☒	☐

Explanation:

Microsoft 365 Copilot does not train the underlying large language model on your organization's tenant data. Instead, it uses your organization's data at run time to ground responses (for example, by retrieving relevant emails or documents you have permission to access). This separation protects confidentiality and supports enterprise compliance.

If a mailbox (or specific folders) is shared with you and your account has the required permissions, Copilot can summarize emails from that shared content because Copilot respects Microsoft 365 access controls ("permission trimming").

Copilot also relies on Microsoft 365's established security and compliance framework—identity, permissions, and policy enforcement—so it only surfaces content you're authorized to see. This ensures Copilot's outputs remain aligned with organizational governance, information protection, and least-privilege access principles.

44.HOTSPOT

Select the answer that correctly completes the sentence.

Answer Area

You generate a report by using the Researcher agent in Microsoft 365 Copilot. You can use  to save and edit the response.

Answer:

Answer Area

You generate a report by using the Researcher agent in Microsoft 365 Copilot. You can use  to save and edit the response.

Explanation:

The correct answer is a page because Microsoft 365 Copilot supports Copilot Pages as a place to capture AI output and then refine it collaboratively. When Researcher generates a report, saving it to a page turns the response into an editable artifact where you can reorganize sections, polish wording, add supporting details, and continue iterating with Copilot while keeping the content structured.

A "conversation" is the chat thread itself and isn't the primary editable format for producing a finalized deliverable. An "agent" is the experience that generates the content, not the storage/edit surface. A "notebook" is used for broader organization of work, but the direct save-and-edit unit for a generated response is the page, which is designed specifically for drafting, editing, and preparing content for business use (for example, exporting or reusing in Word/Teams/Outlook workflows).

45.You need to access Microsoft 365 Copilot from a web browser.

Which URL should you use?

- A. <https://m365.cloud.microsoft>
- B. <https://copilotstudio.microsoft.com>
- C. <https://myapps.microsoft.com>
- D. <https://myaccountmicrosoft.com>

Answer: A

Explanation:

Microsoft 365 Copilot can be accessed via its dedicated web experience for enterprise users. The correct web entry point for Microsoft 365 Copilot is <https://m365.cloud.microsoft>, which provides authenticated

access to Copilot features within the Microsoft 365 environment.

This URL routes users into the Microsoft 365 ecosystem where Copilot integrates with organizational data such as SharePoint, OneDrive, Teams, and Outlook. It ensures that users are authenticated through Microsoft Entra ID and that access controls are enforced according to tenant policies.

Option B refers to Copilot Studio, which is used to build and manage custom copilots and agents rather than access the Microsoft 365 Copilot chat experience.

Option C (My Apps) is a general application launcher portal.

Option D is an incorrect account management URL and does not provide Copilot access.

Therefore, to access Microsoft 365 Copilot from a web browser, the correct URL is <https://m365.cloud.microsoft>.

46.HOTSPOT

You have a Microsoft 365 Copilot license.

You plan to run several prompts.

What should you use to ensure that Copilot generates the best response for each prompt? More than one answer choice may achieve the goal. To answer, select the Best options in the answer area. NOTE: Each correct selection is worth one point.

Answer Area

Prompt 1: From /Feedback_Q1–Q3.xlsx, consolidate all the sheets, categorize the feedback by theme, compute the positive/negative sentiment by product line, and visualize the top five drivers.

The Analyst agent
Chat
The Research agent

Prompt 2: Using our SharePoint folder '/Go-To-Market/2025' and reputable web sources, produce a 1-page brief about AI trends that includes five key insights, citations, and callouts on gaps/risks.

The Analyst agent
Chat
The Research agent

Prompt 3: For a VP, prepare a polished executive email that distills the strategic priorities, critical decisions, and immediate next steps from the attached Strategic_Plan_2025.docx, ensuring that the tone aligns with senior leadership's communication standards.

The Analyst agent
Chat
The Research agent

Answer:

Answer Area

Prompt 1: From /Feedback_Q1–Q3.xlsx, consolidate all the sheets, categorize the feedback by theme, compute the positive/negative sentiment by product line, and visualize the top five drivers.

The Analyst agent ▼

Prompt 2: Using our SharePoint folder '/Go-To-Market/2025' and reputable web sources, produce a 1-page brief about AI trends that includes five key insights, citations, and callouts on gaps/risks.

The Researcher agent ▼

Prompt 3: For a VP, prepare a polished executive email that distills the strategic priorities, critical decisions, and immediate next steps from the attached Strategic_Plan_2025.docx, ensuring that the tone aligns with senior leadership's communication standards.

Chat ▼

Explanation:

Use the Analyst agent for Prompt 1 because it is optimized for structured data work: consolidating worksheets, performing calculations, sentiment breakdowns by category (product line), and producing visualizations. These tasks align with analysis-style workflows where quantitative processing and charting are required.

Use the Researcher agent for Prompt 2 because it is designed to synthesize information from multiple sources, including SharePoint content plus web grounding, and to produce a well-structured brief with citations. Researcher is best when you need evidence-backed insights, reputable sourcing, and an organized narrative with risks and gaps.

Use Chat for Prompt 3 because the goal is drafting a refined executive email based on an attached document with tone control and communication standards. Chat excels at business writing, rewriting, tone adjustment, and producing polished communications without needing the deeper research workflow or heavy data analytics specialization.

47. You use Microsoft 365 Copilot.

You regularly upload the same five files to Copilot chats.

You need to simplify referencing the files in the chats.

What are two ways to achieve the goal?

- A. Send a prompt that includes the files, and then save the prompt.
- B. Create a notebook that references the files.
- C. Ask the data engineers to create a fine-tuned model.
- D. Create an agent that has a knowledge source.
- E. Zip the documents and upload the ZIP file to the chats.

Answer: B, D

Explanation:

Microsoft 365 Copilot provides structured ways to persist and reuse knowledge sources to avoid repeatedly uploading the same files.

Creating a notebook that references the five files (Option B) allows those documents to remain attached within a persistent workspace. Copilot can then consistently ground responses in those files without re-uploading them for every conversation.

Creating an agent with a defined knowledge source (Option D) also provides a reusable solution. By configuring the five files as part of the agent's knowledge base, the agent can automatically reference

them in future interactions.

Saving a prompt does not persist file attachments. Fine-tuning models is not part of standard Microsoft 365 Copilot user workflows. Uploading a ZIP file does not improve reference management and may reduce accessibility of individual documents.

Therefore, the correct solutions are to create a notebook that references the files and to create an agent with a knowledge source.

48.You have a Microsoft 365 subscription.

You do NOT have a Microsoft 365 Copilot license.

When you send a prompt in Microsoft 365 Copilot Chat, which three sources does Copilot Chat use to respond? Each correct answer presents part of the solution. NOTE: Each correct selection is worth one point.

- A. chat data in Microsoft Teams
- B. your organization's databases
- C. the prompt context
- D. organizational data in Microsoft 365
- E. internet search data
- F. the conversation history

Answer: C, E, F

Explanation:

When you use Microsoft 365 Copilot Chat without a Microsoft 365 Copilot license, Copilot Chat operates in a “general” mode rather than a Microsoft Graph-grounded work mode. In this configuration, Copilot does not have the entitlement to access and reason over your organization’s protected Microsoft 365 content (such as SharePoint sites, OneDrive files, Outlook mail, Teams messages, or other tenant resources). It also does not connect directly to your organization’s internal databases unless separate, explicitly configured integrations exist.

Instead, Copilot relies on three primary sources to generate a response: (1) the prompt context you provide in the current request (what you ask, plus any text you paste), (2) the conversation history within the current chat thread to maintain continuity, and (3) internet search data (when web grounding is available) to supplement general knowledge with up-to-date public information.

Therefore, the correct selections are C (prompt context), E (internet search data), and F (conversation history), while organizational Microsoft 365 data and Teams chat data are not used without the Copilot license.

49.You use Microsoft 365 Copilot to create a proposal in Microsoft Word based on a document in a Microsoft SharePoint library.

You need to ensure that the information cited in the proposal is accurate.

What is the best approach to achieve the goal? More than one answer choice may achieve the goal.

Select the BEST answer.

- A. Manually verify the citations in the generated content.
- B. Use Copilot in Word to verify the citations.
- C. Create an agent that contains your organization's editorial standards and use the agent to verify the citations.
- D. Create a notebook that contains all the reference material and use the notebook to verify the citations.

Answer: A

Explanation:

To ensure cited information is accurate, Microsoft's AI guidance emphasizes human verification of AI-generated outputs, especially when the content will be used in formal business documents. Even when Copilot grounds responses in SharePoint files, it can still misinterpret text, summarize imprecisely, or attribute a statement to the wrong section of a source. The most reliable way to confirm accuracy is to check each citation against the original SharePoint document and validate that the claim is supported exactly as written.

Option A is the best answer because manual verification is the definitive control for accuracy and accountability.

Option B may help by asking Copilot to re-check or restate where information came from, but it is still an AI-generated confirmation and does not replace direct source validation.

Options C and D can improve consistency and reuse of standards or references, but they do not guarantee citation correctness; they still depend on model interpretation.

Therefore, the best approach is to manually verify the citations in the generated proposal content.

50. You are using Microsoft 365 Copilot to enhance your productivity in Microsoft Outlook.

Which two tasks can you achieve by using Copilot in Outlook? Each correct answer presents a complete the solution. NOTE: Each correct selection is worth one point.

- A. Insert a custom HTML signature that has specific formatting.
- B. Generate a draft response to an email based on the context of the conversation.
- C. Create a summary of unread emails in your inbox.
- D. Customize the folder structure to organize your emails.

Answer: B, C

Explanation:

Copilot in Outlook is designed to reduce time spent reading and writing email by using AI to summarize message threads and generate drafts grounded in the current email context. Microsoft guidance for Copilot in Outlook highlights core capabilities such as drafting replies that reflect the conversation tone and content, and summarizing email threads or inbox content so users can quickly understand what requires action.

Option B is correct because Copilot can generate a draft reply based on the context of the email conversation, helping you respond faster while keeping the response aligned to what was discussed.

Option C is correct because Copilot can summarize emails—such as unread messages or a thread—by extracting key points, requests, decisions, and suggested next steps, which supports rapid triage.

Option A is not a Copilot task; inserting or customizing an HTML signature is a standard Outlook configuration feature.

Option D is also a traditional Outlook management function and is not an AI drafting/summarization capability.

Therefore, the two tasks you can achieve with Copilot in Outlook are drafting responses and summarizing unread emails.

51. Refer to the exhibit.

You open Microsoft 365 Copilot as shown in the exhibit.

What can you infer about the Standings conversation?

- A. The conversation contains only anonymous data.
- B. The conversation contains a verified response.
- C. The conversation was added to a notebook.
- D. The conversation contains a scheduled prompt.
- E. The conversation was shared.

Answer: B

Explanation:

In the Microsoft 365 Copilot app, the Conversations list can display status indicators next to individual conversation titles. In the exhibit, the Standings conversation has a distinct indicator (a green badge) shown to the right of the conversation name. This badge is used to signal that the conversation includes a verified response.

A verified response indicator is intended to help users quickly recognize outputs that were produced with stronger grounding and traceability—for example, responses that include supporting citations or references that can be reviewed for accuracy. This aligns with Microsoft's guidance on improving trust in AI output by making source-backed or verification-supported responses easier to identify and validate. The other options do not match the indicator shown. Conversations that are shared or added to

notebooks typically use different share/notebook iconography, and scheduled prompts are represented with scheduling-related indicators rather than a verification badge. "Anonymous data" is not something Copilot marks at the conversation level in this manner.

Therefore, the best inference is that the Standings conversation contains a verified response.

52.You run a saved prompt and receive the following response:

"You asked for a summary of File.docx. However, the file appears to be either empty, corrupted, or in a format that I cannot process."

What is a possible cause of the response?

- A. You did NOT schedule the prompt to run.
- B. You ran the prompt from a web app instead of a desktop app.
- C. You used the wrong agent to run the prompt.
- D. You do NOT have access to the file.

Answer: D

Explanation:

When Microsoft 365 Copilot cannot access a referenced file, it may return a message indicating that the file is empty, corrupted, or cannot be processed. In many cases, this message appears when the user does not have sufficient permissions to open the file in SharePoint, OneDrive, or another Microsoft 365 location.

Copilot operates within the Microsoft Graph security boundary and strictly respects user permissions. If a saved prompt references File.docx but the user no longer has access to it—due to permission changes, file relocation, or removal—Copilot cannot retrieve the content for grounding. As a result, it cannot analyze or summarize the file and returns a processing-related error.

Not scheduling the prompt is unrelated to file processing. Running from a web or desktop app does not affect file readability. Using a different agent does not typically cause a file-format processing error.

Therefore, the most likely cause is that you do not have access to the file.

53.You receive several images from a colleague.

You suspect that the images were generated by using Microsoft 365 Copilot.

What can you use to verify whether the images were AI-generated?

- A. file names
- B. watermarks
- C. content credentials
- D. file descriptions

Answer: C

Explanation:

Microsoft's approach to transparency for AI-generated media relies on provenance signals rather than cosmetic indicators. File names and descriptions can be edited easily and are not reliable evidence of how an image was created. Watermarks may appear in some contexts, but they are not consistently applied across all AI image-generation workflows and can sometimes be removed or lost through copying, screenshotting, or file conversion.

Microsoft supports the use of content credentials to help users verify whether digital content was created or modified with AI. Content credentials are part of a provenance standard (often associated with C2PA) that can embed tamper-evident metadata into media files. When present, these credentials can show

information about the tool or process used to generate or edit the image, providing a verifiable chain of origin.

Therefore, the most dependable way to verify whether the images were AI-generated is to check for content credentials (option C), since they are designed specifically to provide authenticity and provenance information for AI-created or AI-edited content.

54.You are using Microsoft 365 Copilot to enhance your productivity in Microsoft Teams.

Which two tasks can you achieve by using Copilot in Teams? Each correct answer presents a complete the solution. NOTE: Each correct selection is worth one point.

- A. Mute and unmute participants in a meeting based on their location.
- B. Create a custom background and add the background to your video calls.
- C. Create a meeting summary, including key decisions and action items.
- D. Draft a response to a channel message based on the context of the conversation.

Answer: C, D

Explanation:

Copilot in Microsoft Teams is designed to help users work faster by summarizing meeting content and assisting with message composition in chats and channels. Microsoft guidance highlights that Copilot can synthesize what was discussed in a meeting by generating a structured recap that includes key points, decisions, and action items. This directly matches option C. Copilot can also help you respond more quickly in Teams conversations by drafting replies grounded in the context of the existing chat or channel thread, which matches option D.

Options A and B are not Copilot capabilities. Muting and unmuting participants is a meeting control function handled by Teams meeting roles and settings, and it is not automatically driven by Copilot based on participant location. Creating custom backgrounds is a Teams visual feature (and can involve Designer or image tools), but it is not a Copilot-in-Teams productivity function for summarization or drafting based on conversation context.

Therefore, the two tasks you can achieve using Copilot in Teams are generating meeting summaries with decisions and action items, and drafting responses to channel messages based on conversation context.

55.You have several separate Microsoft 365 Copilot conversations.

You need to gather the conversations so that you can find them more easily, and the conversations can share the same reference material.

What is the best solution to achieve the goal? More than one answer choice may achieve the goal.

Select the BEST answer.

- A. a notebook
- B. an agent
- C. an app
- D. a page

Answer: A

Explanation:

In Microsoft 365 Copilot, notebooks are designed to organize related work into a single, reusable workspace. A notebook can group multiple Copilot conversations and associate them with shared reference materials (for example, the same set of files, links, or notes). This directly addresses both requirements in the question: (1) making conversations easier to find by collecting them in one place,

and (2) enabling those conversations to use the same reference sources for grounding and continuity. An agent is best when you want a specialized Copilot experience with predefined instructions, capabilities, and (optionally) a configured knowledge source. However, an agent does not primarily function as a “container” to gather and organize multiple existing conversations.

A page is used to capture and edit output (such as a generated report) for collaboration, not to organize multiple conversations with shared references. An app is a broader product surface and does not solve the conversation organization requirement.

Therefore, the best solution is to use a notebook.

56.You attend many Microsoft Teams meetings.

You want to ensure that you can catch up on key points and next steps after each meeting.

Which Microsoft 365 Copilot feature should you use after the meetings?

- A. Recap
- B. Meeting Whiteboard
- C. Meeting info
- D. Thread summaries

Answer: A

Explanation:

After a Microsoft Teams meeting ends, the Microsoft 365 Copilot feature designed specifically to help you catch up on what happened—including key discussion points, decisions, and next steps—is Recap (often referred to as intelligent recap). Recap aggregates post-meeting artifacts such as the recording, transcript, and AI-generated insights, and surfaces actionable items so attendees can quickly understand outcomes without rewatching the full meeting. This aligns directly with the requirement to review “key points and next steps” after each meeting.

Meeting Whiteboard is a collaborative canvas used during meetings for brainstorming and sketches; it does not automatically produce a structured summary of decisions and actions. Meeting info provides logistical details (participants, agenda, attachments) rather than a synthesized outcomes summary.

Thread summaries focus on chat or channel message threads, not the meeting’s recorded and transcribed content.

Therefore, to consistently catch up on key points and next steps after meetings, the correct Copilot feature to use is Recap.

57.You create a Microsoft 365 Copilot notebook and add a file named Process.docx from a Microsoft SharePoint site as a reference.

Yesterday, a user updated Process.docx in the SharePoint site.

What will occur when you chat in the notebook?

- A. The chat will reference only the original version of Process.docx.
- B. The chat will reference the most recent version of Process.docx.
- C. The chat will reference both versions of Process.docx.

Answer: B

Explanation:

When you add a file to a Microsoft 365 Copilot notebook from a Microsoft SharePoint site, you are referencing a document that is stored and managed within Microsoft 365. SharePoint maintains a single authoritative file that can be updated over time (with version history behind the scenes).

Copilot notebooks that reference SharePoint content are designed to stay grounded in the current version of that cloud-hosted document, subject to your permissions.

Because Process.docx is stored in SharePoint, the notebook reference points to the SharePoint document itself rather than a static local snapshot. When another user updates the document in SharePoint, the “latest” content becomes the current version available at that location. When you chat in the notebook, Copilot will use the file as it exists now in SharePoint, which means it will reference the most recent version.

Option A would be typical only if you attached a local file upload (a static copy) rather than a SharePoint-hosted file.

Option C is incorrect because Copilot uses the current file at the referenced location, not multiple historical versions simultaneously.

Therefore, the chat will reference the most recent version of Process.docx.

58.You are a merchandiser who is planning for the upcoming season.

You prompt Microsoft 365 Copilot to suggest which products to stock based on historical sales data. Without reviewing the suggestions or checking current market trends, you place a large order based solely on the output of Copilot.

What is this an example of?

- A. verification
- B. overreliance
- C. fabrication
- D. prompt injection

Answer: B

Explanation:

This scenario is an example of overreliance. Microsoft’s AI guidance highlights that Copilot is an assistive tool that can accelerate analysis and drafting, but users remain responsible for validating outputs—especially for high-impact business decisions. Overreliance occurs when someone treats AI output as authoritative and acts on it without applying judgment, cross-checking sources, or validating against current conditions.

Here, the merchandiser uses Copilot to generate stocking recommendations from historical sales data, then places a large order without reviewing the suggestions or incorporating current market trends. Even if the historical data is accurate, demand can shift due to seasonality changes, competitor actions, pricing, supply constraints, macroeconomic factors, or new product launches. Copilot’s recommendations should be treated as a starting point for decision-making, not the final decision.

Option A (verification) is the opposite behavior—checking accuracy before acting.

Option C (fabrication) would involve Copilot inventing facts; the prompt doesn’t indicate fictional data, only unvalidated reliance.

Option D (prompt injection) involves malicious instructions embedded in content to manipulate the model, which is not described here.

Therefore, the best answer is overreliance.

59.You have an open Microsoft 365 Copilot conversation.

You need to chat with an agent named Agent1 during the conversation.

What should you enter to call Agent1?

- A. [Agent1]
- B. #Agent1
- C. /Agent1
- D. @Agent1

Answer: D

Explanation:

In Microsoft 365 experiences, the standard way to invoke or reference people and specific resources in-context is by using the @mention pattern. Microsoft 365 Copilot extends this familiar interaction model to agents: when you want to switch to, invoke, or direct a question to a specific agent from within an existing Copilot conversation, you use @ followed by the agent's name. This makes the agent selection explicit and reduces ambiguity about which assistant or capability you want to use for the next turn.

The other syntaxes listed are commonly associated with different systems: square brackets are not used for agent invocation, hashtags are typically used for topics/tags, and slash commands are used in some chat applications for command execution—but they are not the standard method for calling a Copilot agent in Microsoft 365 Copilot Chat.

Therefore, to chat with an agent named Agent1 during an open Copilot conversation, you should enter @Agent1.

60.You need to improve prompt-grounding during a Microsoft 365 Copilot conversation.

What is the best approach to achieve the goal? More than one answer choice may achieve the goal.

Select the BEST answer.

- A. Use shorter prompts.
- B. Provide the desired output format.
- C. Avoid technical jargon.
- D. Reference specific files.

Answer: D

Explanation:

Prompt-grounding means ensuring Copilot's response is based on authoritative, relevant source material rather than inferred or generalized information. Microsoft guidance for Copilot emphasizes that the most effective way to ground responses is to explicitly point Copilot to the content you want it to use—such as specific SharePoint documents, OneDrive files, emails, meeting notes, or other Microsoft 365 resources the user has permission to access.

Option D is therefore the best answer because referencing specific files anchors Copilot's reasoning to the exact material that should be used for facts, terminology, and details. This reduces hallucinations (fabrication) and improves accuracy and traceability, especially when Copilot can provide citations back to the referenced sources.

Option B (desired output format) improves structure and readability but does not, by itself, ground content.

Option A can sometimes improve clarity, but shorter prompts do not guarantee grounding.

Option C may help comprehension in some cases, but it is not a grounding strategy and can be counterproductive if the source material is technical.

Therefore, the best approach to improve prompt-grounding is to reference specific files.

61.You plan to use a notebook in Microsoft 365 Copilot.

What is the purpose of a notebook?

- A. to create a transcript of a conversation that you can easily email to other users
- B. to provide a private location that can be used to organize reference materials across related conversations
- C. to generate a summary of all the interactions you had with Copilot during a specific conversation

Answer: B

Explanation:

In Microsoft 365 Copilot, a notebook is a workspace intended to organize and ground related Copilot work. Microsoft guidance describes notebooks as a way to bring together multiple conversations and keep them aligned to the same set of reference materials—such as documents, notes, links, or other resources—so you don't have to repeatedly attach or restate the same context. This improves consistency and prompt-grounding across a set of related tasks (for example, managing a project, developing a proposal, or maintaining a recurring report).

Option B correctly captures this purpose: a notebook provides a private, organized location where reference materials can be curated and reused across related Copilot conversations.

Option A is incorrect because notebooks are not primarily designed to generate email-ready transcripts of conversations.

Option C is incorrect because generating a summary of interactions is a conversation-level function; notebooks are broader organizational containers for materials and related workstreams, not a “summary generator” of a single chat thread.

Therefore, the purpose of a notebook is to organize reference materials across related conversations.

62. You are a marketing assistant preparing for a budget meeting with your manager.

You need to evaluate key spending and performance trends from the last year to understand which marketing channels deliver the best return on investment (ROI).

What should you use in Microsoft 365 Copilot to achieve the goal? More than one answer choice may achieve the goal. Select the BEST answer.

- A. the Analyst agent
- B. Chat
- C. the Researcher agent
- D. a notebook

Answer: A

Explanation:

Evaluating spend and performance trends and determining ROI is a structured analytics task. In Microsoft 365 Copilot, the Analyst agent is designed for quantitative analysis workflows: it can interpret tables, analyze datasets, identify trends over time, calculate metrics (such as ROI), and present results clearly (often including charts or summarized insights). This makes it the best fit when your goal is to compare marketing channels and understand which ones are delivering the strongest return based on last year's data.

Chat (Option B) can help you brainstorm questions or explain results, but it is not purpose-built for deep numeric analysis. The Researcher agent (Option C) is optimized for gathering and synthesizing information from sources and producing research-style outputs, not performing ROI calculations on internal performance data. A notebook (Option D) is useful for organizing files and keeping shared reference material across related conversations, but it does not itself perform the analysis—you would

still need an analysis-capable agent.

Therefore, the best choice to evaluate spending and performance trends and calculate ROI is the Analyst agent.

63.HOTSPOT

From Microsoft 365 Copilot, you add custom instructions.

For each of the following statements, select Yes if the statement is true. Otherwise, select No. NOTE: Each correct selection is worth one point.

Statements	Yes	No
The instructions will apply to new chat conversations.	☐	☐
The instructions will apply to new conversations with the Researcher agent and the Analyst agent.	☐	☐
The instructions will apply to previous responses in existing conversation.	☐	☐

Answer:

Statements	Yes	No
The instructions will apply to new chat conversations.	☒	☐
The instructions will apply to new conversations with the Researcher agent and the Analyst agent.	☒	☐
The instructions will apply to previous responses in existing conversation.	☐	☒

Explanation:

The instructions will apply to new chat conversations. Answer. Yes

The instructions will apply to new conversations with the Researcher agent and the Analyst agent.

Answer. Yes

The instructions will apply to previous responses in existing conversation. Answer. No

Custom instructions in Microsoft 365 Copilot are a persistent preference mechanism that influences how Copilot responds going forward. Once configured, they are applied when you start new interactions, helping Copilot maintain consistent tone, formatting, and behavioral preferences across future chats.

Therefore, they apply to new chat conversations (Statement 1 = Yes).

Custom instructions also carry into new conversations you initiate with Copilot experiences and agents (such as Researcher and Analyst), because the instructions act as a user-level guidance layer that shapes responses regardless of which Copilot “mode” you start—provided those agents are being used in the same Copilot environment and are subject to your settings (Statement 2 = Yes).

However, custom instructions do not retroactively change content that was already generated. Existing conversation history and any prior responses remain unchanged; the instructions affect subsequent turns or new threads, not previously produced outputs (Statement 3 = No).

64.You are comparing the difference between Microsoft 365 Copilot and Microsoft 365 Copilot Chat.

What is available in both versions?

- A. the Researcher agent
- B. Copilot Pages
- C. Copilot Notebooks

Answer: B

Explanation:

Microsoft distinguishes Microsoft 365 Copilot (the full, licensed experience integrated across Microsoft

365 apps and Microsoft Graph) from Microsoft 365 Copilot Chat (the chat-first experience available more broadly). Some advanced capabilities—especially those tied to specialized agents and persistent work organization—are typically associated with the full Copilot license.

The Researcher agent is an advanced capability and is not consistently available in Copilot Chat across tenants because it is treated as a premium agent experience. Copilot Notebooks are also a structured organization feature used to group conversations and share reference materials; this is typically positioned as part of the full Microsoft 365 Copilot experience.

Copilot Pages, however, is the collaborative, editable canvas used to refine, organize, and share Copilot-generated content. Pages is designed to work alongside Copilot Chat so users can move from a chat response into an editable artifact for collaboration and reuse. This makes Pages the feature most commonly available in both the full Microsoft 365 Copilot and Microsoft 365 Copilot Chat experiences. Therefore, the best answer is Copilot Pages.

65. You have a Microsoft Excel workbook open that contains a table.

The table contains sales data and the following columns:

- OrderDate
- OrderNumber
- Amount

You plan to use Microsoft Copilot in Excel to generate a monthly summary of the sales data in the table. What should you include in the prompt to generate an effective summary? More than one answer choice may achieve the goal. Select the BEST answer.

- A. the desired format of the response
- B. a specific cell range from the worksheet
- C. the file name of the workbook
- D. the clear goal of the summary
- E. a formula to calculate monthly totals

Answer: A, D

Explanation:

To generate an effective monthly summary with Copilot in Excel, Microsoft prompting guidance emphasizes two core elements: clear intent and expected output structure. First, you should state the goal explicitly—such as “summarize total sales by month based on OrderDate and Amount, and highlight month-over-month changes.” This directs Copilot to the correct aggregation and analysis behavior (Option D).

Second, specifying the desired format improves usability and reduces ambiguity.

For example, requesting “a table with Month, Total Sales, Number of Orders, and Average Order Value” or “a bulleted executive summary plus a small summary table” ensures Copilot returns results in a format you can immediately use (Option A).

A specific cell range (Option B) is usually unnecessary when the data is already in a recognized Excel table, because Copilot can work from the table context. The workbook file name (Option C) does not help analysis. Providing a formula (Option E) is not required because Copilot can compute monthly totals; formulas are optional if you want a specific calculation method, but they are not the best prompt ingredients for an effective summary.

Therefore, the best answers are A and D.

66. You create a prompt in Microsoft 365 Copilot to help you create a draft project report. You need the prompt to be available in the Copilot Prompt Gallery. What should you do first?

- A. Create a notebook.
- B. Add an agent.
- C. Create a page.
- D. Run the prompt.

Answer: D

Explanation:

In Microsoft 365 Copilot, the Copilot Prompt Gallery is used to store and reuse prompts that have been created and tested. To save a prompt into the gallery, Copilot must first have the prompt as an executed interaction so it can be captured as a reusable prompt (often alongside the context and intended outcome). Microsoft guidance for prompt management emphasizes validating prompts by running them and reviewing the output, then saving the prompt for reuse once it produces the desired results.

Option D is therefore the correct first step: run the prompt. After execution, you can save it to the Prompt Gallery so it becomes easily discoverable and reusable for future project reports or for sharing within your organization (subject to policy).

Creating a notebook is useful for organizing reference materials across related conversations, but it is not required to publish a prompt to the gallery. Adding an agent is for creating specialized assistants with knowledge and capabilities, not for saving a single prompt. Creating a page is used to refine and collaborate on generated content, not to make a prompt available in the gallery.

Therefore, the first action is to run the prompt.

67. HOTSPOT

Select the answer that correctly completes the sentence.

Answer Area

From Microsoft 365 Copilot, you can use  to help users begin conversations with an agent and guide the users to use the agent more effectively.

Answer:

Answer Area

From Microsoft 365 Copilot, you can use  to help users begin conversations with an agent and guide the users to use the agent more effectively.

Explanation:

suggested prompts

In Microsoft 365 Copilot, suggested prompts are designed to help users get started quickly and interact with an agent effectively. Microsoft guidance for Copilot agents emphasizes that many users struggle most at the beginning—knowing what to ask, how to phrase requests, and how to take advantage of an agent's purpose. Suggested prompts address this by providing ready-to-use examples that demonstrate

the best ways to engage the agent for its intended scenarios.

Suggested prompts also act as lightweight “guardrails” for good prompting. They show users the expected input patterns, the types of tasks the agent can perform, and the kinds of outputs they can request. This accelerates adoption and improves the quality of results by steering users toward well-structured requests and appropriate context.

By contrast, capabilities describe what an agent can do (tools/features), instructions define how the agent should behave, and agent settings control configuration. None of those are primarily meant to help users begin conversations through example starters.

Therefore, the correct completion is suggested prompts.

68.HOTSPOT

Select the answer that correctly completes the sentence.

Answer Area

You are using Microsoft 365 Copilot during a Microsoft Teams meeting. After the meeting, you can

only if the meeting was transcribed

schedule a follow-up meeting

create a summary of the meeting chat

identify content that was attached to the meeting

generate a recap of what was discussed during the meeting

Answer:

Answer Area

You are using Microsoft 365 Copilot during a Microsoft Teams meeting. After the meeting, you can

only if the meeting was transcribed

generate a recap of what was discussed during the meeting

Explanation:

Microsoft 365 Copilot in Teams relies heavily on meeting transcripts to provide post-meeting intelligence such as summaries, key points, decisions, and action items. The transcript serves as the structured textual data that Copilot analyzes to understand what was discussed during the meeting.

The feature commonly referred to as recap or intelligent recap is generated based on this transcript.

Without transcription enabled, Copilot lacks the necessary detailed conversation data to accurately reconstruct the meeting content. As a result, generating a recap of what was discussed is only possible when a transcript is available.

Other options such as scheduling a follow-up meeting or identifying attached content do not depend on transcription, as they rely on calendar data or meeting metadata rather than conversational analysis.

However, summarization and recap capabilities are directly tied to the transcript.

Therefore, the correct completion is generate a recap of what was discussed during the meeting, as this action specifically requires the meeting to be transcribed.

69.You create a Microsoft Teams meeting that will only allow the use of Copilot during the meeting. The meeting will NOT be transcribed.

Which statement accurately describes how Copilot can be used during the meeting?

A. Copilot must first be manually activated during the meeting. Copilot can only provide summaries of what was said by the user who activated Copilot.

- B. Copilot will activate automatically when the meeting starts. A complete recap of the meeting will be saved at the conclusion of the meeting.
- C. Copilot must first be manually activated during the meeting. Once activated, Copilot can provide summaries of what was said from that point forward.
- D. Copilot will activate automatically when the meeting starts. Copilot can provide summaries of what was said from the start of the meeting.

Answer: C

Explanation:

When transcription is not enabled, Microsoft 365 Copilot in Teams cannot access a full historical record of the meeting conversation. Copilot relies on transcript data to provide complete summaries and recaps. Without transcription, Copilot can still assist during the meeting, but only from the point at which it is activated.

Copilot does not automatically activate at the start of the meeting; a user must explicitly invoke it. Once activated, Copilot processes the live conversation stream and can generate summaries, key points, or insights from that moment forward only. It cannot reconstruct earlier discussion because no transcript exists for prior content.

Options B and D are incorrect because they assume automatic activation and full-meeting recap capability, which require transcription.

Option A is incorrect because Copilot summarizes the meeting content, not just the speech of the activating user.

Therefore, the correct answer is C.

70. You create and share a Microsoft 365 Copilot agent named Agent1 that contains three suggested prompts. A user named Ben Smith installs Agent1. You add a new suggested prompt to Agent1. You need to ensure that Ben Smith sees the new suggested prompt.

What should you do?

- A. Stop sharing Agent1 and then share the agent again.
- B. Instruct Ben to reinstall Agent1.
- C. Instruct Ben to issue any prompt to Agent1.
- D. Instruct Ben to issue the following prompt to Agent1: -developer on.

Answer: C

Explanation:

Microsoft 365 Copilot agents dynamically reflect updates such as new suggested prompts. When an agent is updated, users who already have the agent installed do not need to reinstall or have the agent reshared. Instead, the updated configuration becomes available when the agent is used again.

Suggested prompts are surfaced when a user interacts with the agent. Therefore, once Ben Smith issues any prompt to Agent1, the agent session refreshes and displays the latest suggested prompts, including the newly added one.

Stopping and resharing the agent (Option A) or reinstalling it (Option B) is unnecessary overhead.

Option D refers to a non-standard command and is not part of Microsoft Copilot functionality.

Thus, the correct action is simply to have the user interact with the agent again.

71. You use Microsoft 365 Copilot.

Which two factors should you consider when creating an effective prompt? Each correct answer presents

a complete solution. NOTE: Each correct selection is worth one point.

- A. adding context to the prompt
- B. using a broad range of instructions in the prompt
- C. using acronyms in the prompt
- D. providing a clear goal in the prompt
- E. keeping the prompt generic

Answer: A, D

Explanation:

Microsoft guidance for effective prompting emphasizes clarity and context as the two most important factors. Providing context (Option A) ensures that Copilot understands the background, data sources, and constraints relevant to the task. This improves grounding and reduces ambiguity, leading to more accurate and useful responses.

Providing a clear goal (Option D) is equally critical. A well-defined objective—such as summarizing, analyzing, or drafting—helps Copilot determine the correct approach, structure, and level of detail for the response. Without a clear goal, outputs may be generic or misaligned with user expectations.

Using a broad range of instructions can introduce confusion rather than clarity. Acronyms may reduce clarity unless explicitly defined. Keeping prompts generic is discouraged because specificity improves quality and relevance of responses.

Therefore, the correct answers are A (adding context) and D (providing a clear goal).

72.HOTSPOT

You use Microsoft 365 Copilot.

For each of the following statements, select Yes if the statement is true. Otherwise, select No. NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
You can delete your conversation history only if your administrator allows you to do so.	☐	☐
When you delete a conversation, the associated files stored in Microsoft SharePoint are also deleted.	☐	☐
When you uninstall a Copilot agent, all the conversations associated with the agent are retained.	☐	☐

Answer:

Answer Area

Statements	Yes	No
You can delete your conversation history only if your administrator allows you to do so.	☒	☐
When you delete a conversation, the associated files stored in Microsoft SharePoint are also deleted.	☐	☒
When you uninstall a Copilot agent, all the conversations associated with the agent are retained.	☒	☐

Explanation:

Microsoft 365 Copilot operates within enterprise governance and compliance controls. For conversation history, tenant administrators can configure retention and deletion policies. Therefore, users can delete

conversation history only if allowed by administrative policy, making Statement 1 correct.

Deleting a Copilot conversation removes the chat interaction but does not delete underlying source files such as documents stored in SharePoint or OneDrive. These files are governed independently by Microsoft 365 storage and retention policies. Hence, Statement 2 is incorrect.

When a Copilot agent is uninstalled, it removes access to the agent interface but does not delete previously generated conversations. Conversations are stored as part of user activity history and remain available unless explicitly deleted (subject to policy). Therefore, Statement 3 is correct.

Thus, the correct responses are Yes, No, Yes.

73. In Microsoft 365 Copilot, you save a prompt.

Which two actions can you perform for the saved prompt? Each correct answer presents a complete solution. NOTE: Each correct selection is worth one point.

- A. Update the title of the saved prompt.
- B. Share the saved prompt to a Microsoft Teams team.
- C. Modify the saved prompt text.
- D. Schedule the saved prompt to run daily.
- E. Remove the saved prompt from the Copilot Prompt Gallery.

Answer: A, E

Explanation:

Saved prompts in Microsoft 365 Copilot Prompt Gallery are designed to be reusable templates for common tasks. Microsoft guidance indicates that users can manage these prompts similarly to other reusable assets—this includes editing metadata and removing them when no longer needed.

Option A is correct because users can update the title of a saved prompt to improve clarity, organization, or discoverability within the Prompt Gallery. This is part of basic prompt management.

Option E is also correct because users can delete or remove saved prompts from the Prompt Gallery if they are outdated or no longer relevant.

Option B is incorrect because prompts are not directly shared to Teams as a native feature; they are typically shared via the Prompt Gallery or copied manually.

Option C is incorrect in this context because saved prompts are generally treated as reusable templates rather than being directly edited in-place (you typically create a new version).

Option D is incorrect because scheduling prompts is not a standard capability of saved prompts in Microsoft 365 Copilot.

Therefore, the correct answers are A and E.

74. HOTSPOT

You are creating an agent in the Microsoft 365 Copilot app.

For each of the following statements, select Yes if the statement is true. Otherwise, select No. NOTE: Each correct selection is worth one point.

Answer Area

Statements	Yes	No
You can configure the agent to search shared mailboxes.	☐	☐
You can use natural language prompts to create the agent.	☐	☐
You can configure the agent to use another agent as a knowledge source.	☐	☐

Answer:

Answer Area

Statements	Yes	No
You can configure the agent to search shared mailboxes.	☒	☐
You can use natural language prompts to create the agent.	☒	☐
You can configure the agent to use another agent as a knowledge source.	☐	☒

Explanation:

Microsoft 365 Copilot agents are designed to integrate with Microsoft 365 data sources and provide flexible, natural-language-driven configuration. Agents can be connected to organizational data such as SharePoint, OneDrive, and Exchange. Since shared mailboxes are part of Exchange Online and accessible through Microsoft Graph (subject to permissions), agents can be configured to search shared mailboxes, making Statement 1 correct.

Microsoft also enables natural language creation of agents, allowing users to describe what the agent should do, its purpose, and behavior using conversational instructions rather than requiring code. This simplifies agent creation and aligns with Copilot's low-code/no-code approach, so Statement 2 is correct. However, agents cannot use other agents as knowledge sources. Knowledge sources are limited to structured content such as files, sites, and data repositories. Agents operate independently rather than being nested or chained as data sources, making Statement 3 incorrect.

Thus, the correct answers are Yes, Yes, No.

75.HOTSPOT

You have a Microsoft 365 Copilot conversation as shown in the following exhibit.

Use the dropdown menus to select the answer choice that completes the statement based on the Information presented in the graphic.

Answer Area

Document1.docx [answer choice]

- is in a notebook.
- has a sensitivity label applied.
- is NOT a supported file type.
- is NOT accessible outside of your organization.

Answer:

Answer Area

Document1.docx [answer choice] has a sensitivity label applied.

Explanation:

In Microsoft 365 Copilot, when content from a document is summarized or referenced, Copilot respects Microsoft 365 security, compliance, and data protection policies such as sensitivity labels. Sensitivity labels can restrict how content is accessed, shared, or processed, and Copilot behavior reflects these constraints.

The exhibit shows that Copilot is able to summarize the document but provides only limited or generalized insights, indicating restricted handling of the content. This is consistent with documents that have sensitivity labels applied (for example, Confidential or Highly Confidential), where Copilot may limit exposure of detailed content or apply safeguards when generating responses.

Other options do not align with the scenario. If the file were not supported, Copilot would not process it at all. If it were inaccessible outside the organization, that would affect sharing rather than summarization behavior. Being in a notebook does not impose restrictions on how content is summarized.

Therefore, the correct inference is that Document1.docx has a sensitivity label applied.

76.HOTSPOT

You plan to create an agent by using the Microsoft 365 Copilot app.

For each of the following statements, select Yes if the statement is true. Otherwise, select No. NOTE:

Each correct selection is worth one point.

Answer Area

Statements	Yes	No
The agent will be available in Microsoft Word.	☐	☐
The agent can be shared to other users in your organization.	☐	☐
The agent can contain complex workflows that use third-party connectors.	☐	☐

Answer:

Answer Area

Statements	Yes	No
The agent will be available in Microsoft Word.	☐	☒
The agent can be shared to other users in your organization.	☒	☐
The agent can contain complex workflows that use third-party connectors.	☐	☒

Explanation:

Agents created in the Microsoft 365 Copilot app are primarily designed for use within the Copilot Chat experience and related Copilot surfaces, not directly embedded inside individual applications like Word. Therefore, such agents are not automatically available in Microsoft Word, making Statement 1 incorrect. However, these agents are designed for collaboration and reuse within an organization. Microsoft guidance confirms that agents can be shared with other users in the same tenant, allowing teams to leverage common tools, prompts, and knowledge sources. Hence, Statement 2 is correct.

For advanced automation scenarios involving complex workflows and third-party connectors, Microsoft provides Copilot Studio rather than the standard Copilot app. The Copilot app focuses on lightweight agent creation using natural language, files, and simple configurations. It does not support complex orchestration with external connectors. Therefore, Statement 3 is incorrect.

Thus, the correct answers are No, Yes, No.

77. You have an open Microsoft Word document that has a sensitivity label named Highly Confidential applied. From Microsoft PowerPoint, you plan to use Microsoft 365 Copilot to generate a presentation of the Word document.

What will be the result?

- A. Copilot will generate the presentation and will prompt you for a label.
- B. Copilot will generate the presentation and will NOT apply a label.
- C. Copilot will generate the presentation and apply the Highly Confidential label.
- D. Copilot will be unable to generate the presentation.

Answer: C

Explanation:

Microsoft 365 Copilot fully respects Microsoft Purview Information Protection, including sensitivity labels applied to documents. When content is used as a source to generate new content (for example, creating a PowerPoint presentation from a Word document), Copilot ensures that data protection policies are preserved and inherited.

If the source Word document is labeled Highly Confidential, the generated presentation will automatically inherit the same sensitivity label. This ensures that the classification, encryption, and access restrictions applied to the original content are consistently enforced in derived content. This behavior aligns with Microsoft's compliance and data governance model, which prevents accidental data exposure when content is reused or transformed.

Option A is incorrect because Copilot does not require manual reclassification when a label is already present on the source.

Option B is incorrect because labels are not dropped during content generation.

Option D is incorrect because Copilot can still generate content from labeled documents, provided the user has access.

Therefore, the presentation will be generated with the Highly Confidential label applied.
